ORCHIDS

FACTSHEET ON INDIA'S ORCHIDS IN ILLEGAL WILDLIFE TRADE
Orchids are one of the most prized ornamental plants traded as flowers and potted plants globally\textsuperscript{12}. The term “orchid” has been derived from the Greek word “orchis,”	extsuperscript{13} and taxonomically, placed in the order Asparagales under Orchidaceae family. Orchids belong to the second-largest family of flowering plants, and there are more than 29,500 orchid species worldwide\textsuperscript{14}. IUCN Global Red List has assessed about 1641 orchid species (July 2020) of which 747 are categorised as ‘Threatened’ with 197 listed as ‘Critically Endangered’\textsuperscript{15}. India is home to 1,256 species belonging to 155 genera. Of these, 307 species are endemic to the country\textsuperscript{16}.

DO YOU KNOW?

- Orchids are hypoallergenic as their pollen is not airborne; instead, it is stored in a waxy substance, pollen packets called pollinia\textsuperscript{17}.
- Fossil evidence suggests that orchids emerged over 80 – 100 million years ago\textsuperscript{18}.
- Orchids have the smallest seeds amongst the flowering plants in the world\textsuperscript{19} and they are very difficult to grow requiring unique micro-habitats\textsuperscript{20}.
- About 8% of all flowering plants are orchids\textsuperscript{21}.
- Orchid species have been recognised for their medicinal properties in the ancient Indian therapeutic system of Ayurveda\textsuperscript{1}.
- In India, Arunachal Pradesh is home to about 40% of orchid species in the country\textsuperscript{11} and is often referred to as the ‘Orchid Paradise of India.’

ECOLOGICAL ROLE

Since orchids are highly sensitive to the climatic changes in their habitat and have extensive, interconnected symbiotic relationships with organisms like insects, plants, and fungi, their presence is a positive indicator of the healthy ecosystem and the biodiversity of their habitat. Orchids play a vital ecological role by constituting a crucial element of any forest ecosystem through a highly complex mutual relation with other organisms\textsuperscript{22}.
ECOLOGICAL ROLE

Since orchids are highly sensitive to the climatic changes in their habitat, their presence is a positive indicator of the healthy ecosystem and the biodiversity of their habitat. Orchids play a vital ecological role by forming a crucial element of any forest ecosystem through a highly complex mutual relation with other organisms like insects, plants, and fungi. Their small seeds are stored in a waxy substance, pollen packets called pollinia. Asparagales under Orchidaceae is the largest family of flowering plants, and taxonomically, placed in the order Asparagales. The Greek word “orchis” has been derived from the word “orchis” which means a ‘thick growth’. Instead, it is stored in a waxy substance, pollen packets called pollinia. Orchids are hypoallergenic as their pollen is not airborne; 27 of India’s 125 endemic orchid species are orchids. About 8% of all flowering plants are orchids. Of these, 307 species are endemic to the country. 11 of these species are orchids. In India, Arunachal Pradesh is the Paradise of India.’

In India, Oberonia recurva is the smallest orchid while the Falconer’s Galeola Galeola falconeri is the largest orchid species.

DO YOU KNOW?

Orchids are one of the most prized potted plants globally. They are orchids. Of these, 307 species are endemic to the country. 11 of these species are orchids. In India, Arunachal Pradesh is the Paradise of India.’

Orchid size can range from a pencil head to a vigorous two tonne shrub. In India, Oberonia recurva is the smallest orchid while the Falconer’s Galeola Galeola falconeri is the largest orchid species.

SIZE, HABITAT, DISTRIBUTION AND POPULATION STATUS:

CONSERVATION STATUS

INTERNATIONAL UNION FOR CONSERVATION OF NATURE (IUCN) RED LIST

Drury’s Paphiopedilum Paphiopedilum druryi (Critically Endangered)
Fairrie's Paphiopedilum Paphiopedilum fairrieanum (Critically Endangered)
Charlesworth Paphiopedilum Paphiopedilum charlesworthii (Endangered)
Laddy’s Slipper Orchid Paphiopedilum venustum (Endangered)
Spicer’s Paphiopedilum Paphiopedilum spicerianum (Endangered)
Splendid Paphiopedilum Paphiopedilum insignis (Endangered)
Ward’s Paphiopedilum Paphiopedilum wardii (Endangered)
Villoso Paphiopedilum Paphiopedilum villosum (Vulnerable)
Shaggy Paphiopedilum Paphiopedilum hirsutissimum (Vulnerable)

#Besides the above-mentioned genera, the orchid species listed in the other 154 genera are also listed under various threatened categories of the IUCN.

WILDLIFE (PROTECTION) ACT, 1972

CONVENTION ON INTERNATIONAL TRADE IN ENDANGERED SPECIES OF WILDLIFE AND FLORA (CITES)

Appendix I: Pigeon orchid Dendrobium cruentum, Ladies slipper orchids Paphiopedilum spp., Red Vanda Renanthera imschootiana
Appendix II: Orchidaceae spp. i.e all species excluding the species included in Appendix I.

EXPORT IMPORT (EXIM) POLICY

Blue vanda Vanda coerulea, Dactylorhiza hatagirea, Ladies slipper orchid Paphiopedilum species, Red vanda Renanthera imschootiana, Orchids Orchidaceae species

Exports of plants and plant portions of wild origin, of species specified in the Export Licensing Note 1 is prohibited.

A special exemption can be granted for research, education, and life-saving drugs on a case-by-case basis by DGFT, on the recommendation of the Ministry of Environment, Forests and Climate Change.
THREATS

HABITAT DESTRUCTION AND FRAGMENTATION

One of the most pertinent threats to orchids today is habitat destruction and degradation\(^4\). Climate change too, is harming the species as it has a significant impact on pollination services and affects the plant communities where orchids exist\(^6\).

OVER HARVESTING FOR ILLEGAL WILDLIFE TRADE

Orchids are one of the most threatened flowering plants in the world. Illegal harvesting and overexploitation pose a severe threat with species like *Renanthera* spp and a few slipper orchids such as *Cypripedium*, *Paphiopedilum*, showing significant impact from the practice\(^3\).

Orchids are illegally collected and traded for ornamental plants, traditional medicine, and food\(^5\). The increasing demand for it is leading to unsustainable harvesting practices. Orchids like *Eulophia dabia*\(^15\) and *Dactylorhiza hatagirea* populations are succumbing to overharvesting\(^16\).

*Crepidium acuminatum*, *Habenaria edgeworthii* and *Habenaria intermedia* are collected from the wild for their medicinal use. They are used in making Chyawanprash, a popular dietary supplement in India.

Protected species of orchids such as Blue Vanda, Ladies Slipper have been seized in India with seizures reported in West Bengal\(^7\) and Assam\(^8\) and by Department of Revenue Intelligence (DRI)\(^7\).
CONSERVATION EFFORTS

Sessa Orchid Sanctuary, in West Kameng District, Arunachal Pradesh, has been established to conserve the orchid species of the region along with an Orchid Research and Development Centre to study and preserve the species.

In 2020, IUCN, in collaboration with the Government of Arunachal Pradesh, launched the "IUCN Red-Listing Process of Orchids species assessment in Arunachal Pradesh" as a short-term objective towards evaluating the more than 600 unique and diverse Orchid species of the state.

SECURING THE FUTURE OF ORCHIDS IN INDIA

1. Raise awareness among local people to encourage them to preserve the wild orchid species in their area.

2. Promote sustainable and traceable use of threatened orchids in legally permitted areas through village level Biodiversity Management Committees as an additional source of livelihood.

3. Include medicinally and ornamentally valuable orchids such as Renanthera, Cypripedium, Paphiopedilum, Habenaria intermedia, H. pubescens, Eulophia dabia, Dactylorhiza hatagirea, threatened by illegal trade and overexploitation the various Schedules of Wildlife (Protection) Act, 1972 of India for protection and to restrain their overharvesting from the wild.
